# CONTRIBUTION JOURNAL

## 1. JENNIFER R.

For contribution for lab 10, I first start as always having everything prepared in GitHub organized and easy to find for my team members, with a separate repository as per required for the assignment along with a folder where every team member can add their collaboration and keeping everything organized. I then worked on lab 10 while trying to understand the new concepts but also trying to understand the coding part. Then lastly, I put everyone's contribution together so that it can be prepared and ready to be turned in into GitHub.

## 2. MARTIN H.

For Lab 10, I spent my time reading the instructions and going through the project to understand what we were doing. I looked at the code and tried to understand how it works and what each part does. I also reviewed my teammates' work so I could follow the steps and learn more about the new topics. My main goal was to understand the project better and learn how everything works in machine learning.

## 3. MARCUS W.

Examined the instructions to know what to expect from the task. Then tested the coding in a different private environment to ensure consistency and to get a more clear view of the topic and be more efficient. Helped with reviewing submitted project documents and helped in the teams' reflection/contribution journals.
